Preamble

Climate predictions provide information about the **probability** of anomalous climatic conditions occurring in a relatively **near future (months, seasons, a few years)**, helping to address, manage and mitigate potential severe impacts across a broad spectrum of socio-economic sectors.

Therefore, climate predictions represent an extremely useful tool for adaptation in a changing climate

The basis for climate predictions

How is it possible to make climate predictions considered that weather is a chaotic system?

Edward N. Lorenz (1917–2008)

The atmosphere is a **chaotic system**: due to the strong non-linearities of the atmospheric dynamics, simulations (predictions) of the evolution of the atmosphere are very sensitive to (small) changes in their initial conditions.

Limit of deterministic predictability: given by the growth rate of the (inevitable) errors in the initial state → the atmosphere loses memory of its initial conditions after a **few days** (limit of about 10–15 days).

Predictability of the first kind (or initial value problem)

The memory of the **land-surface** (snow, soil moisture, vegetation) to initial conditions can extend **to several months**

The memory of the **ocean** to initial conditions can range **from months to (many) years**.

The basis for climate predictions

Ocean, land surface and sea-ice are characterised by slower dynamical processes, providing a long-term memory which leads to skill in predicting climate evolution.

Even though **individual weather events** are not predictable beyond 10 days, the ***average weather behaviour*** (climate) may be **influenced by predictable boundary conditions** (e.g. land-surface, ocean, ...) for **several months or longer**.

(Palmer, 1998)

Predictability of the second kind (or boundary conditions problem)

How do we do climate predictions?

To sample the uncertainty in initial conditions we perform ensemble forecasts with perturbed initial conditions.

Readapted from Trzaska (<http://portal.iri.columbia.edu>)

The external forcing (ocean and land-surface anomalies) makes some state more probable than others

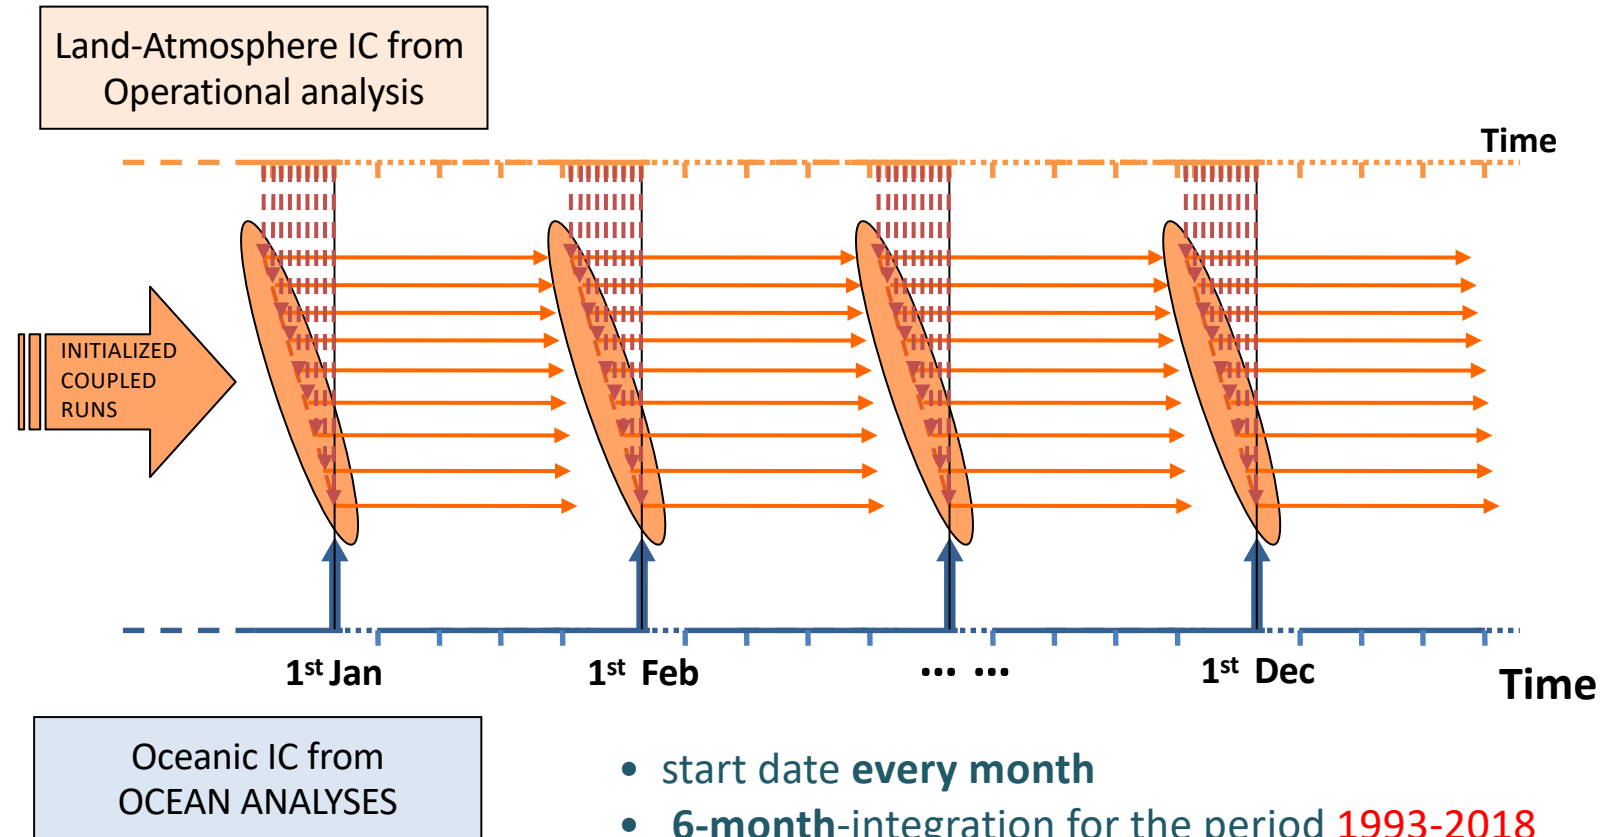

How do we do climate predictions?

The operational setup: forecast and **re-forecasts** (forecast in the past) for validation) and calibration

Climate Model

Seasonal

- start date **every month**
- **6-month**-integration for the period **1993-2018**
- **12 start dates** per year (once a month)
- **50 ensemble members** for each start date

How do we do climate predictions?

Climate Change

DJF 2021-2022 Prediction – Start date: 2021 November 1st

(reference period 1993–2016)

C3S multi-system seasonal forecast

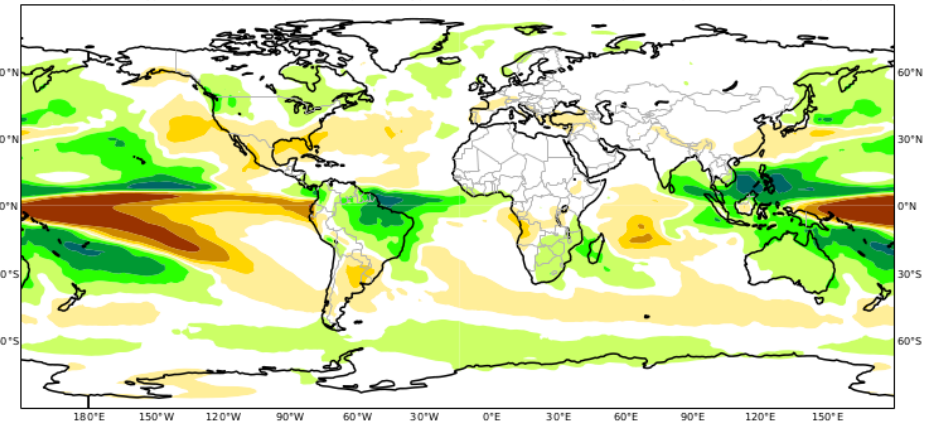

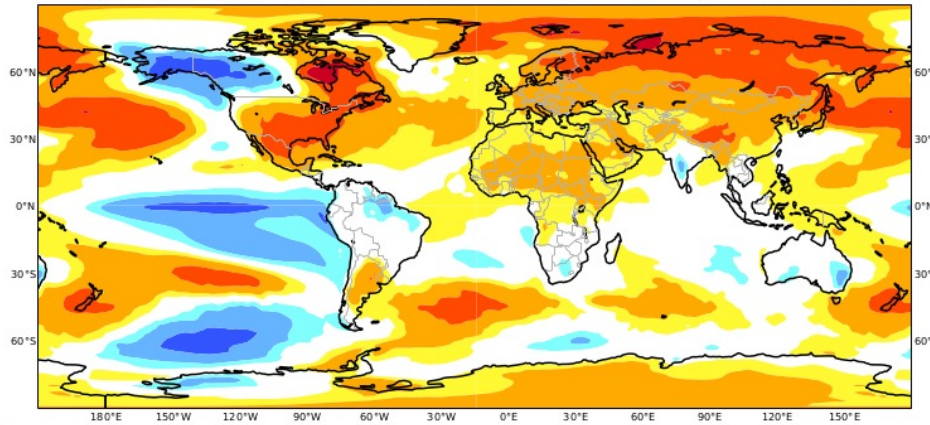

T2m

Precipitation

DJF mean anomaly

Legend for T2m: <-2.0°C, -2.0..-1.0, -1.0..-0.5, -0.5..-0.2, -0.2..0.2, 0.2..0.5, 0.5..1.0, 1.0..2.0, > 2.0°C

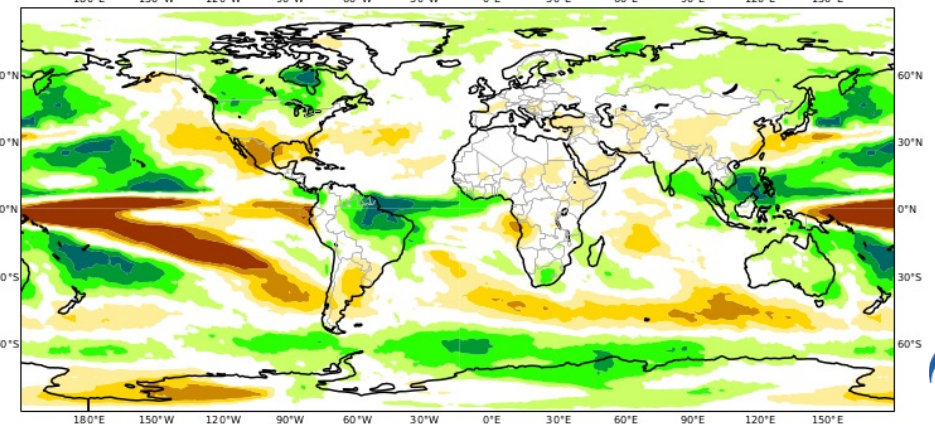

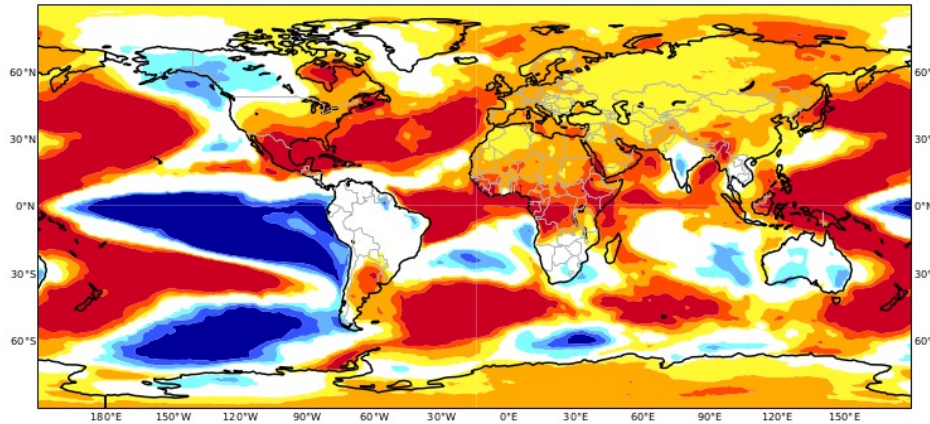

Legend for Precipitation: <-200mm, -200..-100, -100..-50, -50..-10, -10..10, 10..50, 50..100, 100..200, > 200mm

DJF probabilistic forecast

Legend for T2m probabilistic forecast: <--- below lower tercile, above upper tercile --->. 70..100%, 60..70%, 50..60%, 40..50%, other

Legend for Precipitation probabilistic forecast: <--- below lower tercile, above upper tercile --->. 70..100%, 60..70%, 50..60%, 40..50%, other

How good are seasonal predictions?

T2m ACC

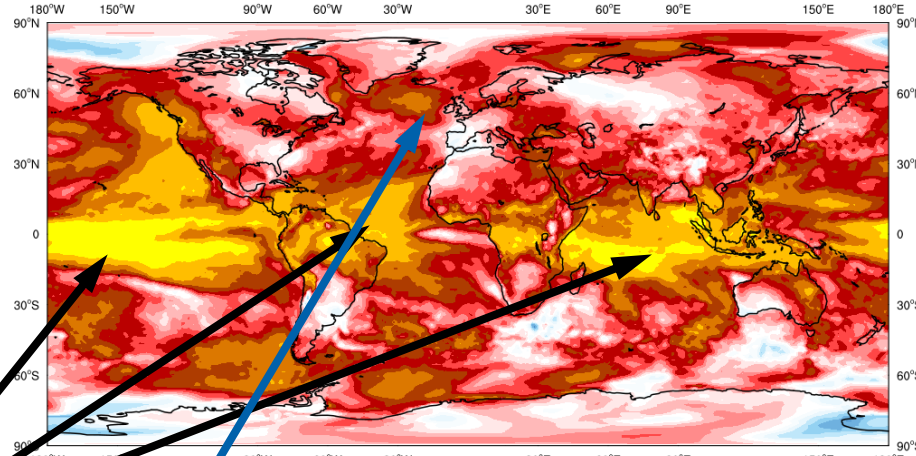

(reference period 1993 – 2016)

Lead season 1

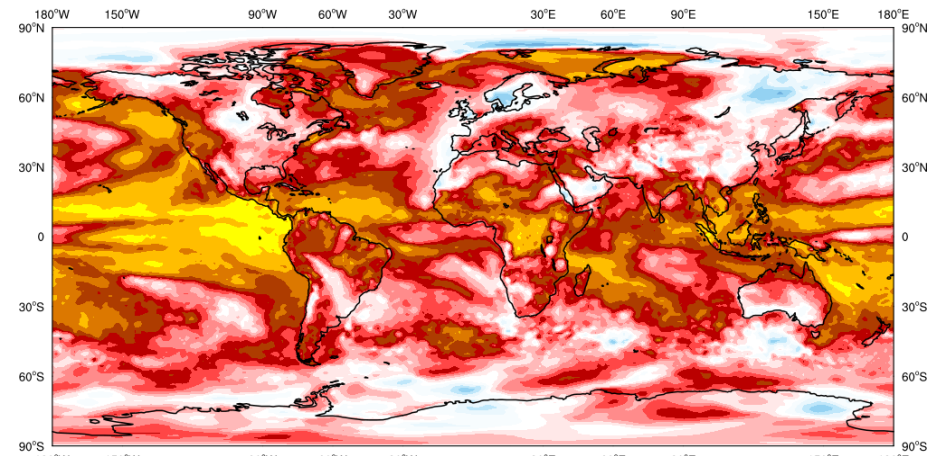

Lead time 1 refers to the season starting one month after the start date (e.g. Feb lead 1 = MAM)

- Skill is higher in the Tropical oceans (ENSO and teleconnections) and extra-trop. Pacific
- Good skill in the northern Atlantic region, particularly in the winter and the spring

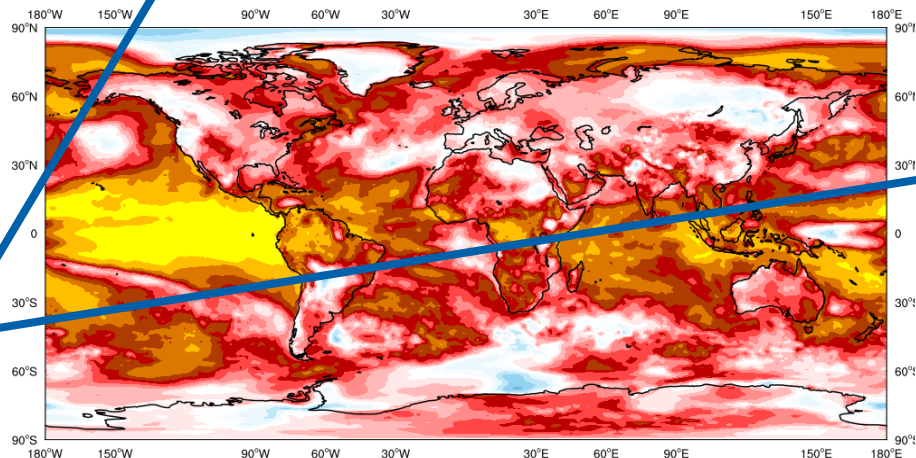

Feb 1st → MAM

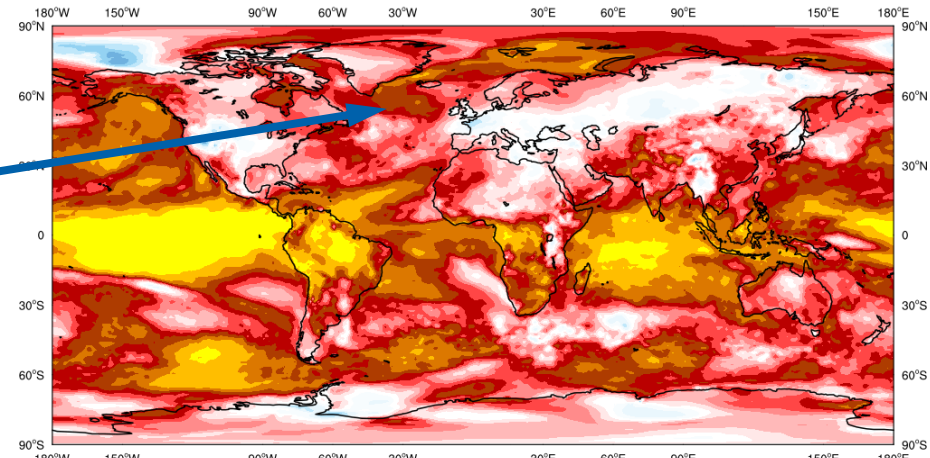

May 1st → JJA

Aug 1st → SON

Nov 1st → DJF

How good are seasonal predictions in the Mediterranean region

DJF Forecasts
initialised on
November 1st

C3S multi-system
(5 prediction systems)

Anomaly Correlation Coefficients
with respect to ERA5, 1993 – 2014

2m-Temperature

Precipitation

How good are seasonal predictions in the Mediterranean region

JJA Forecasts
initialised on
May 1st

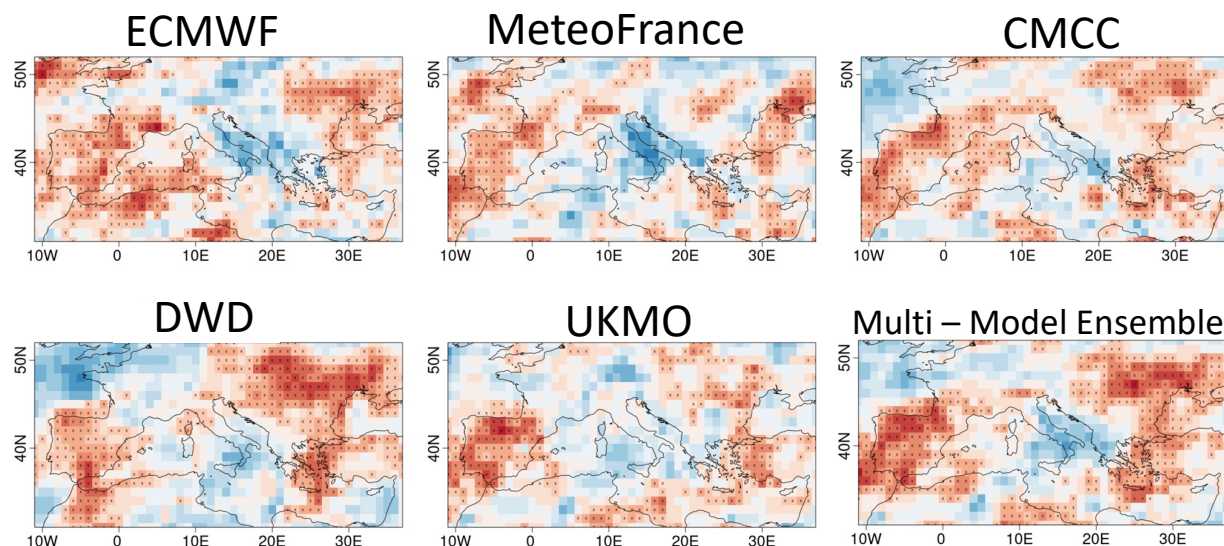

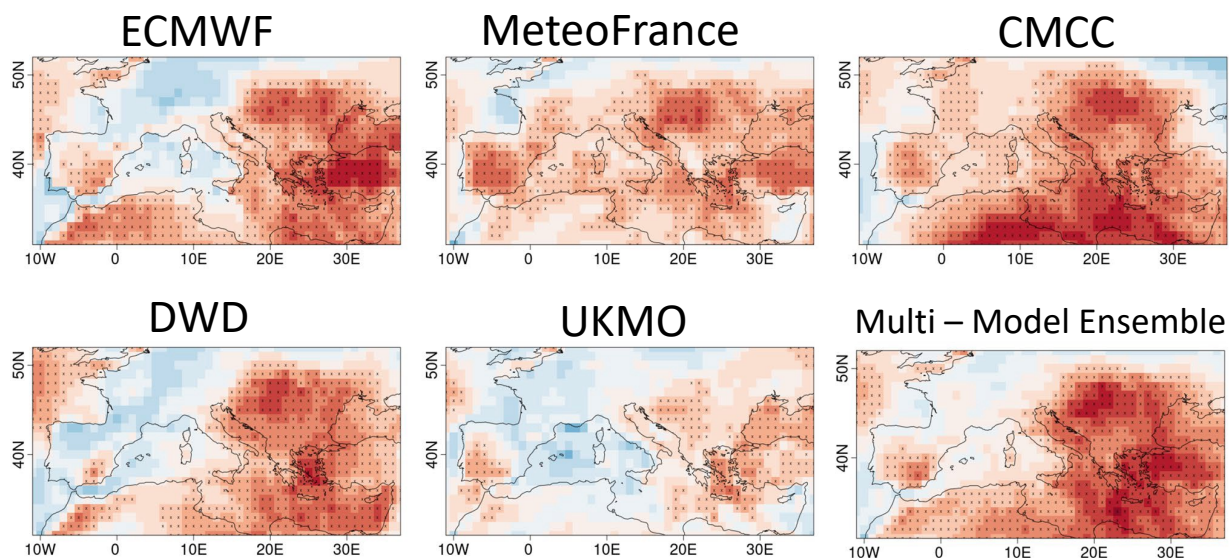

C3S multi-system
(5 prediction systems)

Anomaly Correlation Coefficients
with respect to ERA5, 1993 – 2014

2m-Temperature

Precipitation

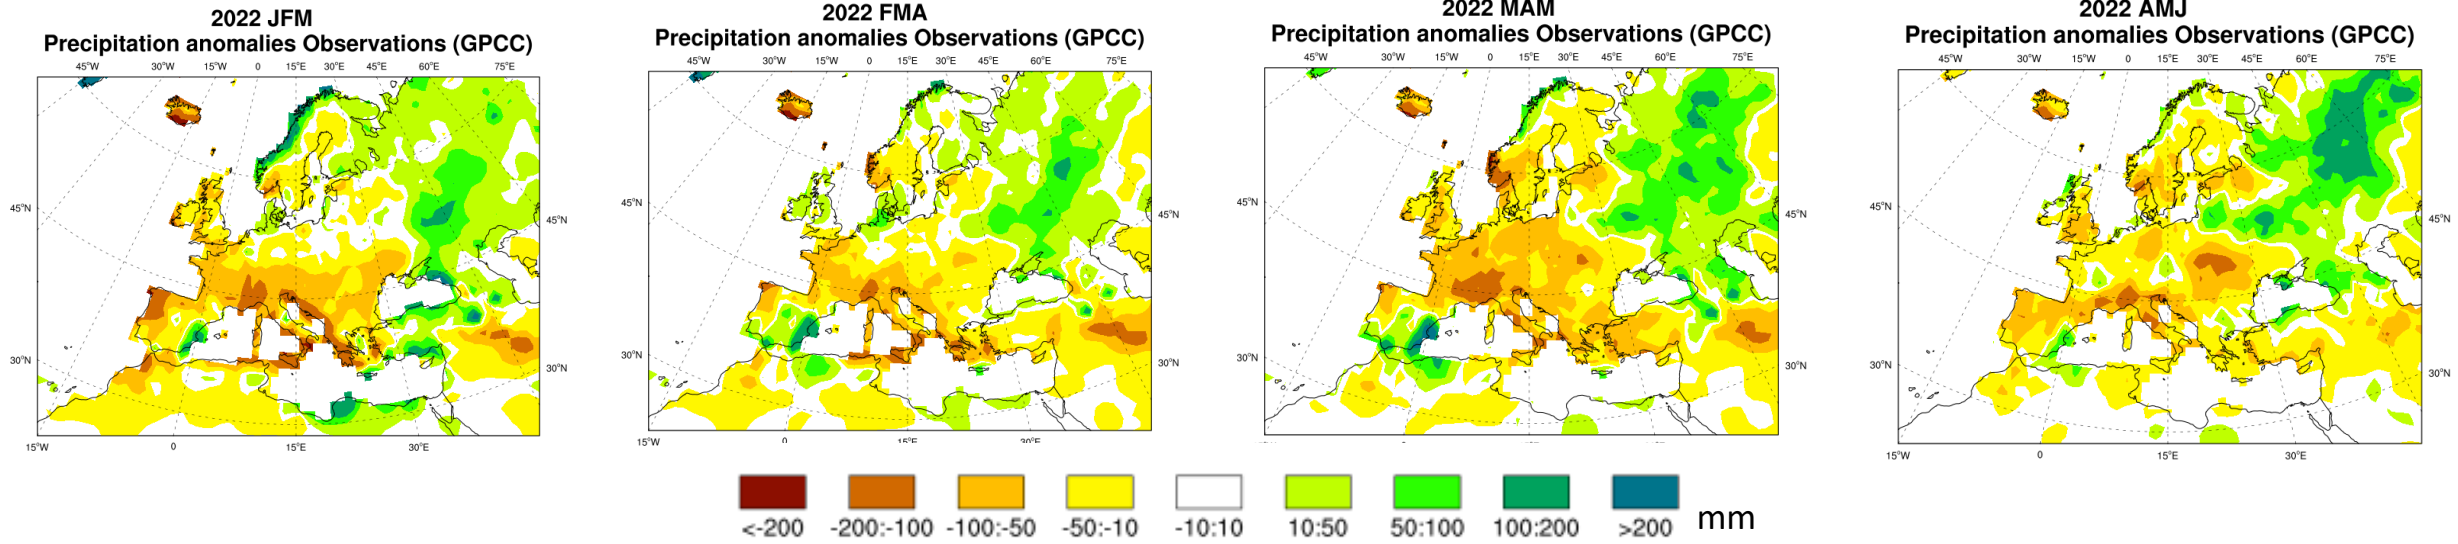

Stippling = significant correlations (95% confidence level).

Modified from Cali Quaglia et al. 2021

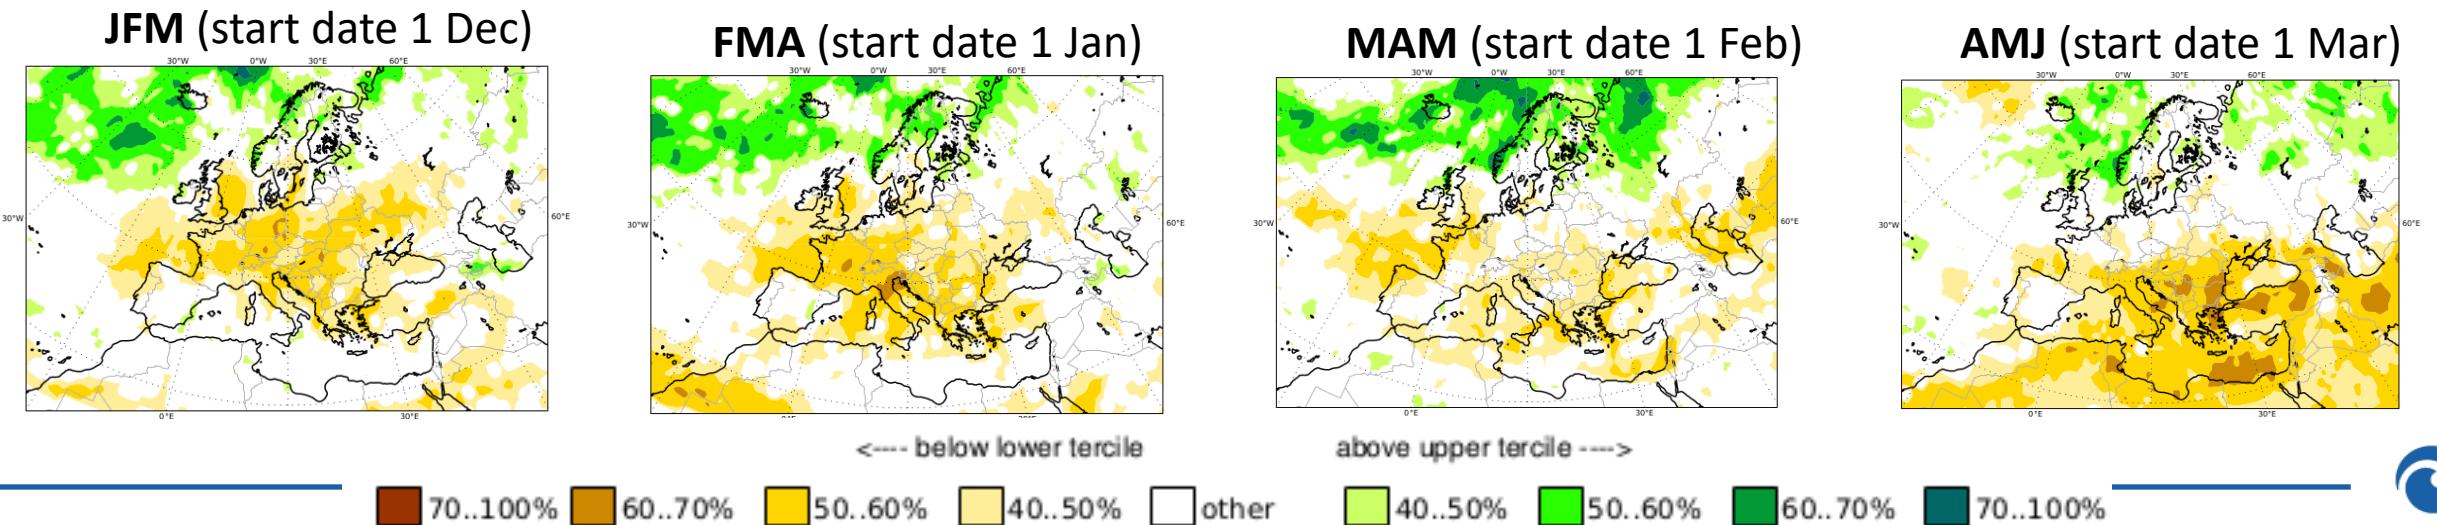

A case study: 2021–2022 drought

Reference period: 1993 - 2016

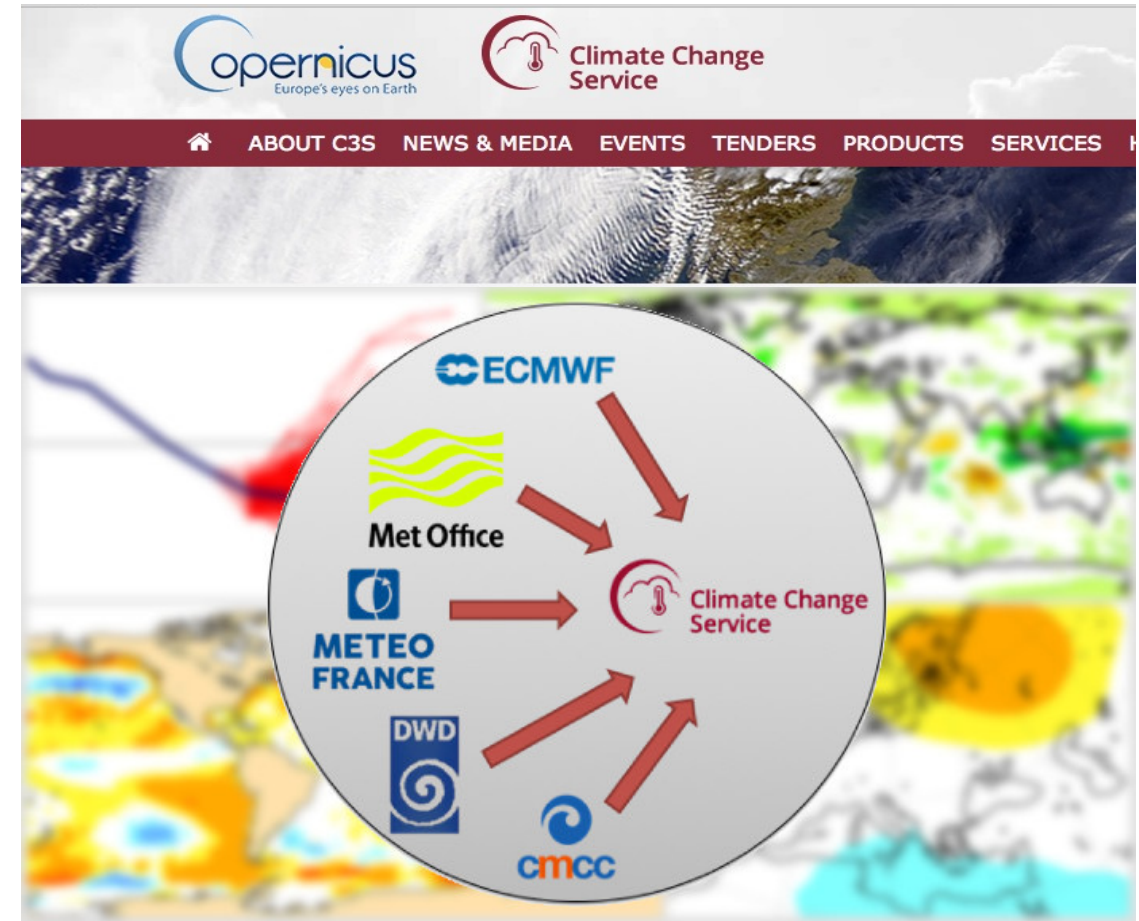

Precipitation forecast: Probability (most likely category of precipitation)

Where is it possible to find information and data?

International Program for Operational Seasonal Predictions

<https://www.wmolc.org/>

<https://climate.copernicus.eu/seasonal-forecasts>

Examples of application

Autumn (Oct–Nov–Dec) 2023 Prediction – Start date 1st of September

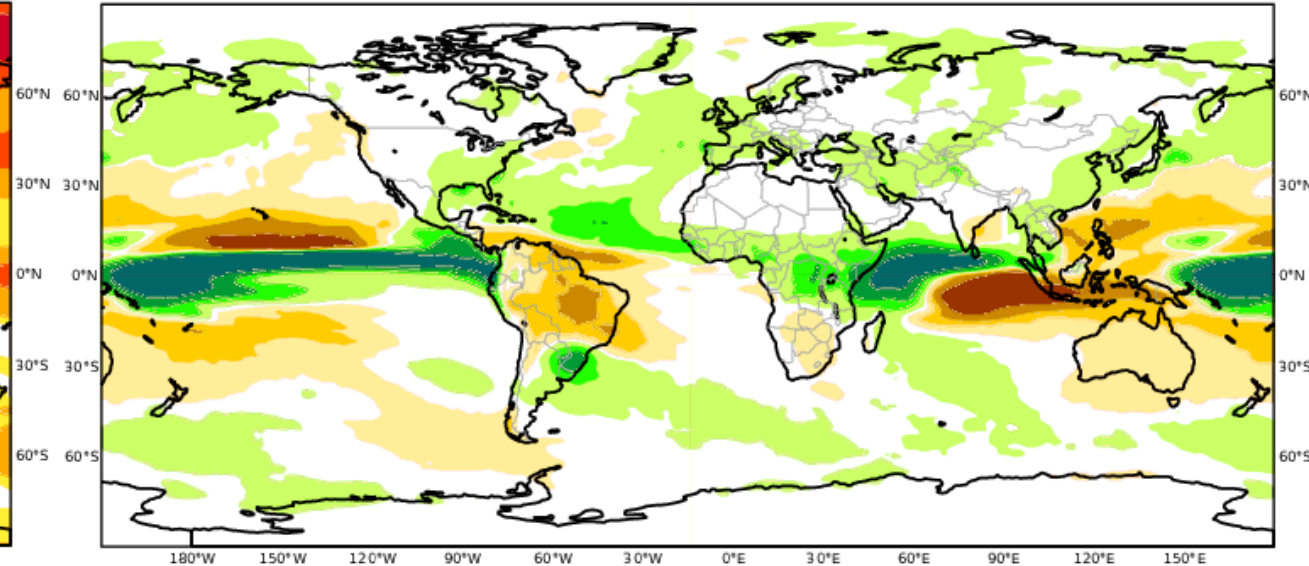

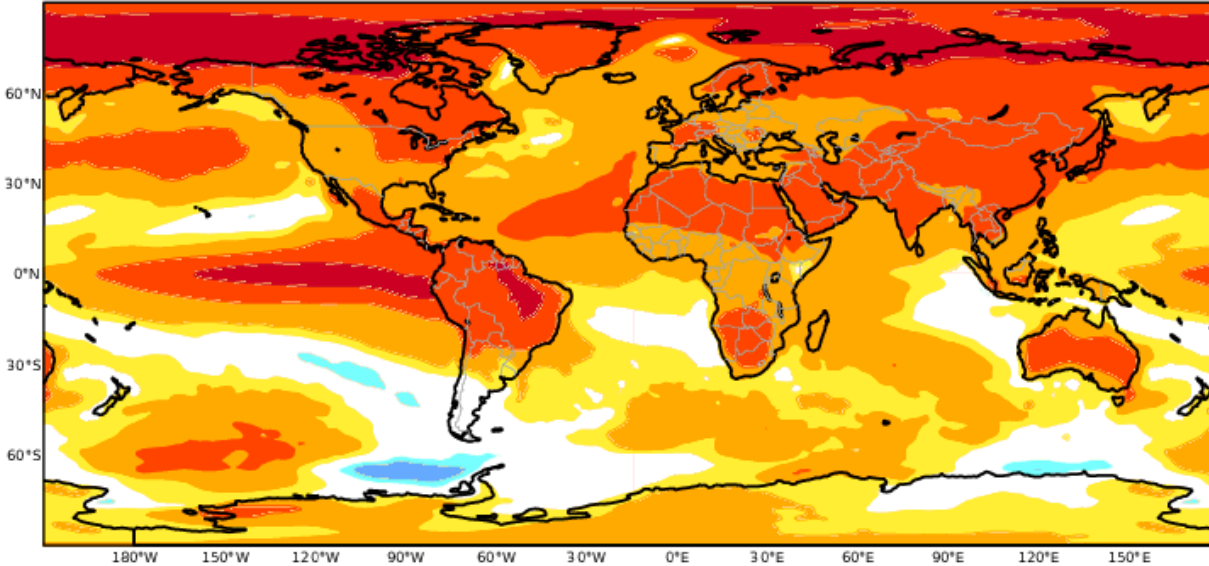

(anomalies wrt to the reference period 1993 – 2016)

C3S multi-system seasonal forecast
Mean 2m temperature anomaly
Nominal forecast start: 01/09/23
Variance-standardized mean

ECMWF/Met Office/Météo-France/CMCC/DWD/NCEP/JMA/ECCC
OND 2023

C3S multi-system seasonal forecast
Mean precipitation anomaly
Nominal forecast start: 01/09/23
Variance-standardized mean

ECMWF/Met Office/Météo-France/CMCC/DWD/NCEP/JMA/ECCC
OND 2023

Thanks
