Shared Perspectives Workshop (10/07/2023)

# Can we sensibly assess the growth impacts of sustainability?

Prof. Dr. Karen Pittel

### Will Sustainability Deter or Spur Economic Growth?

#### ifo INSTITUT

### Agenda

### **Impacts of Climate Change**

### **Impacts of Emission Reduction and Climate Policy**

### **Impacts of Climate Change**

### **Impacts of Climate Change**

Illustrative examples from individual studies of risks to living standards and the conditions under which they could become severe

World

Aggregate GDP

#### CEVA

Global GDP losses of 10–23% by 2100 due to temperature impacts alone (3; 12; 13)

Poverty

#### CEVA

35–132 million people pushed to extreme poverty by 2030 (6; 10)

Livelihoods

#### 

330–396 million people could be exposed to lower agricultural yields and associated livelihood impacts (4)

#### Arctic Regions

Livelihoods

#### CEVA

Populations dependent on hunting and fishing face severe livelihood, cultural, and economic risks (14)

#### United States of America

Inequality

#### CEVA

Economic damages as share of income in 2100 are 9 times larger in the poorest 5% of counties than in the richest 5% (5; 9)

Latin American and the Caribbean
• Poverty

5.8 million people pushed to extreme poverty by 2030 (7; 11)

Developing Countries

• Aggregate GDP

GEV A 9% average loss in GDP by 2100 (1)

Tropics and Coastal Regions • Livelihoods

Climate-sensitive livelihoods, such as agriculture and fisheries, would be severely impacted (8; 15) Africa • Inequality

#### CEVA

Projected convergence in country-level incomes by 2050 is delayed by 10 years (2)

Sub-Saharan Africa

Aggregate GDP

GDP losses of 10–15% by 2050 (2)

GDP losses of 80% by 2100 (3)

Livelihoods

#### 62% of the population are currently employed in climate-sensitive agricultural sector (16)

Poverty

#### GEVA 39.7 million people pushed to

extreme poverty by 2030 (7; 11)

East Asia and Pacific

· Poverty

CEVA 7.5 million people pushed to extreme poverty by 2030 (7; 11)

South Asia

Poverty

#### CEVA

35.7 million people pushed to extreme poverty by 2030 (7; 11)

Livelihoods

40% of the population are currently employed in climatesensitive agricultural sector (16)

# **Impacts of Climate Change**

"Estimates of the global effects of climate change on aggregate measures of economic performance and gross domestic product (GDP) range from negative to positive, in part due to uncertainty in how weather variability and climate impacts manifest in GDP (high confidence)."

"Under high warming (>4°C) and limited adaptation, the magnitude of decline in annual global GDP in 2100 relative to a non-global-warming scenario could exceed economic losses during the Great Recession in 2008–2009 and the COVID-19 pandemic in 2020."

"Regional estimates of GDP damage vary ... Severe risks are more likely in (typically hotter) developing countries..."

# **GDP** Impact of Non-Sustainability

Highly likely to be **negative**.

Extent: Depends on

- success in reducing climate change etc.
- technological options/choices and regulation

#### Also:

Mostly not considered when assessing GDP effects of climate policies.

Impact on welfare beyond GDP?

# Impacts of Emission Reduction and Climate Policy

# **Impacts of Climate Policy**

#### Forecasts for the EU: GDP impact of the energy transition

ifo INSTITUT

Morgan Stanley (2023)

### **Climate Policy Choice**

#### Real GDP (Percent deviation from baseline)

Package 1	Package 2	Package 3
Gradual GHG price increase from 2023 to 2030	Gradual GHG price increase from 2023 to 2026	Gradual GHG price increase from 2023 to 2030
Two-thirds of revenue used to reduce labor taxes	One-third of revenue used to reduce labor taxes	GHG revenue rebated at the sectoral level (electricity generation, manufacturing, services)
One-third of revenue transferred to households	One-third of revenue transferred to households	GHG revenue from households' activities (residential energy and individual transportation) transferred back to households
	One-third of revenue used to subsidize low-emission sectors: • Renewables investment	Regulation of share of electric vehicles
	<ul> <li>Nuclear and hydro power plants</li> <li>Electric-vehicle purchase</li> </ul>	

# Current (EU) Bottlenecks

- Expansion of renewable energies (and energy prices)
- Market development (green) hydrogen
- Decarbonization of industry
- Decarbonization of buildings and transport
- Expansion and conversion of infrastructure (power grids, charging stations,...)

#### Mostly an expression of underlying challenges

 $\succ$ 

# **Challenges Behind the Bottlenecks**

international competitiveness

financing and investments

support for climate policy

shortage of skilled workers

bureaucracy and approval processes

### **Delay of Climate Policy**

ifo INSTITUT

# The long term: Technologies for Climate Neutrality

Technology readiness level of technologies along the low-carbon electricity value chain

# The long term: Path to Climate Neutrality

**Assessment for Germany** 

ifo INSTITUT

Kopernicus Project Ariadne (Levi et al.) 2021

# **6 Propositions**

- 1. Climate policy must use the potential of the market.
- 2. Climate policy must use sectoral, regional and temporal flexibilities and set reliable framework conditions.
- 3. Climate policy must be politically enforceable and immediately take distributional effects into account.
- 4. Climate policy must flank CO2 prices with targeted measures so that they have their full effect.
- 5. Climate policy must mobilize private investment on a large scale.
- 6. Climate policy must be designed internationally.

### Thank you for your attention!
